

09/24419

ABSTRACT OF THE DISCLOSURE:

In an image workflow system for use in transferring an operation document image to a network including a destination terminal, an image identifying server 12 identifies a species, an operation of the operation document image, and a destination by the use of an identification table and a workflow control table. The species, the operation, and the destination are transferred to the destination terminal in the form of a packet together with the operation document image through the network. Responsive to the operation document image, the destination terminal activates a program and edits the operation document image in accordance with the operation.
